

NEET[®]SHEETS is the only patented elastic free ergonomic bedding system engineered to reduce hotel housekeeping staff injuries, accelerate room turns, and strengthen staff retention across high volume properties. It introduces a new category of bedding that replaces outdated, labor intensive methods and eliminates the physical strain, inefficiency, and constant mattress lifting built into traditional bed making.

NEET[®]SHEETS is designed for hospitality environments where room turns, consistency, and staff well being directly influence guest experience and labor cost. The system aligns with widely recognized ergonomic principles OSHA highlights for reducing strain in manual tasks and supports efforts to lower operational, labor, and injury related costs across entire hospitality organizations. Independent university results show 75 percent less mattress lifting effort, 47 percent faster bed making, a 53 percent productivity increase, and a significant reduction in musculoskeletal strain.

Fitted NEET[®]SHEET

The patented Fitted NEET[®]SHEET uses multidirectional edges and two adaptive corners that release tension as the sheet is applied. This ergonomic design helps the sheet glide onto the mattress with less lifting and pulling than a traditional fitted sheet, reducing repetitive strain and musculoskeletal stress for room attendants. Once in place, the adaptive corners help the sheet stay securely positioned throughout the guest stay, supporting faster bed making and consistent alignment across rooms.

Fitted NEET[®]SHEET 2.0

The patented Fitted NEET[®]SHEET 2.0 features four integrated hospital corners and no bottom elastic band, creating a simpler, more efficient bed making process. The sheet naturally aligns on first placement and requires only a quick tuck. Removal is equally easy as attendants lift each corner without pulling, stretching, or bending. The anchored corner structure helps the sheet remain stable without excessive tension, maintaining a smooth sleep surface and reducing the physical effort required during turnover.

Top/Flat NEET[®]SHEET

The patented Top NEET[®]SHEET includes a stretchable alignment band that forms two hospital corners at the footboard side, ensuring correct placement on the first try. This eliminates time spent repositioning and measuring while helping the sheet stay centered during the guest stay. The design maintains a crisp, uniform appearance without the tight, restrictive tucking that can reduce guest comfort, supporting both operational efficiency and a more relaxed sleep experience.

Decorative NEET[®]SHEET

The patented Decorative NEET[®]SHEET is designed for both protection and presentation. Placed between the comforter and the top sheet, it reduces direct contact with the comforter while using stretchable lateral fabric to create two precise hospital corners. These corners help the layer stay in place without overtightening the bedding, maintaining a polished, consistent look and supporting a more comfortable guest experience. This added stability also helps preserve the room's presentation between cleanings.

NEET[®] Thermal Blanket

The patented NEET[®] Thermal Blanket incorporates two built in hospital corners at the footboard side, allowing the blanket to align correctly on first placement. These corners help the blanket stay positioned during guest use without requiring tight tucks, supporting both consistent presentation and a more relaxed, comfortable feel for guests. The stable alignment also reduces the need for mid stay adjustments by housekeeping.

NEET[®] Comforter

The patented NEET[®] Comforter includes two integrated hospital corners at the footboard side, helping it naturally align with the mattress during placement. This alignment system reduces handling time and helps the comforter stay in place without being pulled excessively tight, supporting a smoother, more comfortable guest sleep experience. The consistent placement also helps maintain brand standards and visual uniformity across rooms.

Crinkle NEET[®]SHEET

The patented Crinkle NEET[®]SHEET pairs NEET[®] alignment technology with wrinkle concealing fabric. With two hospital corners at the footboard side, the sheet aligns quickly and stays positioned more reliably, while the textured fabric helps disguise wrinkles. The design maintains a neat appearance without restrictive tucking, supporting a more comfortable guest experience.

Universal NEET[®]SHEET

The patented Universal NEET[®]SHEET is designed for properties that use King flat sheets as both the bottom sheet and the top sheet on their King and Queen beds. Unlike a regular flat sheet, the Universal NEET[®]SHEET has one anchor corner with alignment technology that secures the sheet to the mattress, helping it stay in place across multiple bed sizes. This reduces adjustment time and constant retucking, simplifies inventory, speeds up room turns, and maintains a smooth, comfortable sleep surface without the tight tucking often required when adapting one size of sheet to multiple beds.

Pillowcases

Multiple sizes available to match selected NEET[®]SHEETS bedding components; not patented or ergonomic at this time but included for a complete, coordinated set.
